We transferred our proven technology of finished bottle bulk conveyors to the PET preform bulk handling and we added specific design solutions due to the differences between moving blown bottles and preforms. Lanfranchi Preform bulk conveyors guarantee high process efficiency and total integrity of the preforms quality.
With these conveyors it is now possible to safely feed the blowing-machines whilst keeping under strict control the whole process. The main structure is in stainless steel AISI 304 complete with upper covers and controlled by frequency inverters. These conveyors were designed in order to avoid any jam and hence damages to preforms and they are normally installed when the loading point is not near the blowing-machine.
